SUMMARY

Product Manager who builds AI-native B2B marketing and sales products end to end, with 5 years in high-growth B2B SaaS. At Aviso, took a lead-intelligence platform from zero to production — intent scoring, website visitor intelligence, an AI SDR inbound avatar, and real-time lead routing — adopted by 50+ users and lifting conversion 15–20%. Writes AI-centric PRDs, HLDs, and LLDs that start with the problem, sets success metrics before the first line of code, owns QA, release sign-off, failure alerting, and post-deploy monitoring, and ships in prioritized phases. Owns the KPIs: tracks usage and adoption in Amplitude, runs competitor research, and closes the loop between customers, data, and the roadmap. Uses Claude Code daily to build working demos, writes Python to automate data operations, and ships first versions hands-on with n8n, Supabase, and Azure AI Foundry.

CORE COMPETENCIES

AI-Native & Agentic Products · 0→1 Product Development · Roadmap Ownership & Prioritization · AI-Centric PRDs, HLD & LLD · QA, Release Sign-Off & Observability · Rapid Prototyping with Claude Code · Success Metrics & KPI Ownership · Usage & Adoption Analytics · Competitive Research · Scoring & Decisioning Systems · Agentic RAG & LLM Fine-Tuning · REST API Contracts & Integrations · Debugging & Failure Alerting · CRM & MarTech Integrations · Data & AI/ML Products · Model Evaluation (Precision, Recall, F1)

Tools: Claude Code · Python · SQL · n8n · Supabase · Azure AI Foundry · Amplitude · Jira · GitHub · Google AI Studio

EXPERIENCE

Aviso — Product Manager, Lead Intelligence & Enrichment **Oct 2025 – Present**

- **Launched a lead-intelligence and decisioning platform from zero to production**, reaching 50+ users and lifting conversion 15–20%; tracked usage and adoption in Amplitude and ran competitor research to decide what to build and in what order.
- **Built working product demos daily with Claude Code** to get feedback early and give backend and frontend engineers a clear, clickable picture of what to build before development starts.
- **Shipped first versions hands-on** by building workflows in n8n, Supabase, and Azure AI Foundry, getting products in front of users before full engineering builds.
- **Owned QA, release sign-off, and post-deploy monitoring** — wrote positive and negative test cases, signed off each release before it went live, and monitored live behavior through Azure AI Foundry observability (tracing and logs) and an admin panel.
- **Debugged multi-system integrations proactively, not reactively** — set up reports and failure notifications that pinpoint where a handoff between systems breaks, and used Claude Code to trace bugs across integrations too complex to inspect by hand, catching critical issues during testing before release.
- **Wrote HLDs, LLDs, and AI-centric PRDs** that engineering and Data Science build directly from, each starting with the problem and carrying a clear success criterion.
- **Owned the AI SDR Inbound Avatar — a conversational avatar embedded on the website** that qualifies inbound prospects and schedules demo requests; defined the interaction flow, knowledge-base management, and phased scope, and built a working agentic RAG side-panel demo of the experience in n8n.
- **Designed the org-level intent-scoring engine** — a 50+ signal taxonomy across web, CRM, and marketing automation, weighted and time-decayed into a single 0–100 score that ranks accounts by buying intent.
- **Shipped Website Visitor Intelligence that de-anonymizes site traffic** — resolving anonymous visitors to companies at ~98% match accuracy and grading them hot/warm/cold from page-level behavior — so reps act on in-market accounts in real time.
- **Built a lead router that captures inbound form-fills and assigns each lead to the right owner in real time**, halving speed-to-lead and improving response time 30% across CRM, Slack, and email.
- **Defined the ICP-fitness scoring model** — the configurable firmographic and behavioral signal set, weights, and fit thresholds that score every account against a team's ideal profile — cutting low-quality leads ~25%.
- **Built a GTM prospecting and enrichment platform** that runs open prospecting, unifies CRM leads, contacts, and opportunity data, and enriches accounts into named decision-makers (VP/C-suite) with third-party intent (Bombora, G2), reading each provider's REST API contracts to define the integration.
- **Partnered with Data Science on a recommendation system that routes each lead to the owner most likely to convert it**, learned from patterns in past wins, improving assignment quality and rep acceptance.
- **Owned the core company and people data that data scientists use to build models** such as job-title classification and ICP scoring, making data quality a direct input to model performance.

6sense — Product Manager, Core Data Assets & Enrichment Systems **Oct 2021 – Oct 2025**

- **Wrote a Python script that automated data-operations work**, cutting the data refresh cycle from once every 6 months to a 2-day cadence.
- **Built a data-enrichment platform integrating multiple external providers** into scalable pipelines — reading each provider's REST API contracts to define the integration — powering audience and identity data across global datasets.
- **Raised job-title classification accuracy from 70% to 90%** by partnering with Data Science on predictive models (email-pattern generation, title-to-function and level mapping), evaluated on precision, recall, and F1, while reducing vendor dependency.
- **Built the truth set and validation set with Data Science that the job-title classification model was trained and tested on** — a function that takes a raw job title and returns job function and level — with manual validation of output before release.
- **Held data consistency at 96–98% at scale** through validation checkpoints and anomaly-detection systems across the core data foundation.
- **Closed 75%+ of critical data gaps** across people and company records by unifying vendor datasets and enforcing data standards.
- **Owned the core company and people data that data scientists used to build their models** — including job-title classification and ICP scoring — making data scientists the primary users of the product.

Infosys — Associate Consultant, Financial Services **May 2021 – Sept 2021**

- **Led root-cause analysis on delivery risks** and translated business requirements into structured problem statements across engineering, QA, product, and business teams.

AI PROJECTS

github.com/sarthakgupta0303

- **Agentic RAG Knowledge Hub (n8n):** built an agentic RAG that answers from uploaded documents and indexed websites, stitching front end and back end in n8n; adapted it at Aviso as a side-panel demo of the inbound-avatar experience.
- **Legal Assistant LLM (Azure AI Foundry):** fine-tuned GPT-4o on MSA and NDA agreement types and their key terms to build a domain-specific legal assistant.

EDUCATION & CERTIFICATIONS

MBA, Finance — International Management Institute, New Delhi 2019 – 2021

B.Tech, Mechanical Engineering — Manipal University 2011 – 2015

Certifications: Data Product Management Specialization (Udacity Nanodegree); Mastering Product Management.
